

TV Guide Using TV Maze and Utelly

Suppose you were interested in watching a new tv show, or you wanted to watch an old series a friend recommended to you. But with channels and video streaming services constantly adding and dropping shows, it can be difficult to locate where to watch your shows. Not anymore. Our TV guide will let you know where you can start, catch up, or simply binge your favorite tv shows.

TV Maze is a free API that gives information about current tv listings on cable tv. This includes data on show names, what channels the show is playing on, and even a real time look at when that show is playing on the channel. Using this data, we could create a function that takes the input of a user (tv show name) and display information on that show.

Utelly works similarly to TV Maze. It is also an API that gives information on tv shows but instead of cable, the data is for video streaming services like Netflix, Amazon Prime, or iTunes. We felt that it was necessary to add Utelly because it expanded the number of places you could watch the same show. For example, Game of Thrones is a show that you can find playing Sunday night at 9:00 pm HBO, but you can also watch Game of Thrones on Amazon Prime or iTunes.
